

# MELTr

BRANDING & VISUAL STYLE GUIDE / v1.0

# MELTr

# MELTr

```
$ meltr generate --profile enterprise --count 1M  
  ▶ Forging telemetry... [██████████] 87%  
  ▶ Emitting events, logs, metrics, telemetry...
```

Fabricate the signal.

Metrics. Events. Logs. Telemetry. One tool to forge realistic data for the systems that have to survive it.

# 01 / Brand idea

MELTr is an engineering tool for fabricating synthetic telemetry that looks real enough to stress a SIEM. The identity should feel built, not decorated: industrial process translated into precise digital output.

## Core idea

Four streams enter a controlled process. They converge, flow, and emerge as structured signal. The logo therefore combines forge, flow, and precision without relying on literal cybersecurity symbols.

## Brand personality

**FORGE / PRECISION / FLOW**

Forge gives the system physicality and engineering credibility.

Precision keeps it technical, disciplined, and trustworthy.

Flow communicates telemetry moving through a pipeline and becoming usable output.

## What it is not

Not playful. Not cyberpunk cliché. Not an AI startup gradient. Not a shield, lock, log-file, mascot, or generic four-letter enterprise acronym.

## 02 / Logo system

### Primary lockup

The preferred identity is the independent symbol paired with the exact wordmark MELTr. The lowercase r is part of the name, not a stylistic afterthought.

### Construction principles

- Four converging paths establish the fabrication metaphor.
- The central pour communicates transformation without depicting literal molten metal.
- Horizontal telemetry lines create the transition from flow to structured output.
- The wordmark remains legible and mechanically consistent at every size.

# 03 / Mark architecture

## The symbol

The mark should work independently of the wordmark. Its silhouette combines a controlled convergence with an output stream, making it useful as a CLI glyph, favicon, application icon, repository avatar, and documentation marker.

## Recommended hierarchy

1. Full lockup — product, website, presentations, documentation.
2. Symbol — favicon, CLI, app icon, social avatar, compact UI.
3. Wordmark — editorial or horizontal contexts where the symbol is already established.

# 04 / Color system

The palette deliberately avoids the default 'AI orange' treatment. Orange is an operational accent — a controlled heat signal inside a mostly mineral environment.

## Usage ratio

70–80% charcoal / steel neutrals    15–20% warm white / steel text    5–10% orange / amber signal accents

Do not turn the entire identity orange. The accent should feel like heat passing through an otherwise cold, engineered system.

# 05 / Typography

Typography should feel like an engineering interface rather than a marketing campaign. Use a technical sans for primary UI and a monospace face for commands, telemetry, labels, and metadata.

## Primary

DEJAVU SANS / OR A SIMILAR NEUTRAL TECHNICAL SANS

Use for headlines, body copy, navigation, documentation, and product UI.

## Monospace

DEJAVU SANS MONO / OR A SIMILAR ENGINEERING MONOSPACE

Use for CLI commands, generated output, identifiers, metrics, timestamps, and technical labels.

## Wordmark rule

The product name is always written MELTr. Preserve the capital M-E-L-T and lowercase r. Never normalize it to MELTR or Meltr.

# 06 / Graphic language

The visual system extends the logo's core transition: flow → convergence → structure.

## Primary motifs

- Parallel lines that converge into a single path.
- Short telemetry bars with unequal lengths.
- Industrial frames, plates, stamps, and measured geometry.
- Fine grid lines used sparingly as construction references.
- Small orange/amber interruptions that behave like signal, not decoration.

## Visual behavior

Prefer hard edges, controlled spacing, asymmetry with purpose, and high contrast. Use texture only when it reinforces materiality. Avoid glossy 3D, excessive glow, holographic effects, and generic circuit-board patterns.

### A useful rule

If a graphic could appear unchanged on an AI SaaS landing page, it is probably too generic for MELTr.

# 07 / Product expression

MELTr is local-first and CLI/API oriented. The brand should therefore feel equally natural in a terminal and in a polished web interface.

## Example terminal voice

```
$ meltr generate --profile enterprise --count 1000000
▸ Forging telemetry..... 87%
▸ Emitting events, logs, metrics, telemetry...
```

## UI principles

- Dense but readable information hierarchy.
- Monospace for machine-generated content.
- Orange reserved for active state, process, warning, or important signal.
- Charcoal surfaces with subtle separation rather than cards everywhere.
- Avoid excessive rounded corners; use engineered geometry.

# 08 / Usage rules

## Do

- Preserve the exact MELTr capitalization.
- Keep the symbol recognizable at small sizes.
- Use generous negative space around the mark.
- Use orange as a signal accent, not a background color.
- Prefer monochrome versions when reproduction is constrained.

## Don't

- Do not change the r to uppercase.
- Do not add shields, locks, padlocks, server stacks, or generic cybersecurity imagery.
- Do not add purple AI gradients or rainbow neon effects.
- Do not stretch, bevel, rotate, outline, or decorate the wordmark.
- Do not treat the four-source concept as a literal four-quadrant logo.

## Minimum clear space

Use a minimum clear space around the full lockup equal to the height of the lowercase 'r'. When in doubt, give the logo more room rather than less.

# MELTr

FORGE THE SIGNAL.

This first-pass brand system establishes the foundation: a dark industrial environment, controlled heat, technical typography, and a mark built around flow becoming structured signal.

## Next design layer

Finalize vector artwork for the symbol and wordmark, establish exact construction geometry, create production-ready monochrome/reversed variants, and define favicon/app-icon geometry from the independent symbol.
